Nanotechnology for Photovoltaics

Loucas Tsakalakos

Nanotechnology for Photovoltaics Loucas Tsakalakos

Current concerns regarding greenhouse gas-related environmental effects, energy security, and the rising costs of fossil fuel-based energy has renewed interest in solar energy in general and photovoltaics in particular. Exploring state-of-the-art developments from a practical point of view, **Nanotechnology for Photovoltaics** examines issues in increasing efficiency, decreasing costs, and how these two goals can be achieved in a single photovoltaic device. It provides fundamental background and places research approaches within the proper physical context as related to photovoltaics performance enhancement.

The book reviews the applications of devices and their performance requirements, followed by coverage of thin films and advanced band structure concepts for obtaining efficiencies above the Shockley–Queisser single bandgap efficiency limit of ~31%. The editor and contributors also discuss the basic optical properties of nanostructured materials as related to photovoltaics applications and describes nanoscale optoelectronic device physics related to performance. They then explore recent literature in the application of various classes of nanostructures to photovoltaics. The book covers solar cells based on hybrid organic-inorganic nanocomposites structures, quantum wells, nanowires/tubes, and quantum dots. It also discusses the use of nanoparticles/quantum dots to enhance the performance of conventional solar cells and luminescent solar concentrators.

Each chapter summarizes the historical development for the nanostructure class under consideration, applications beyond photovoltaics, and the major synthetic methods, followed by a critique of leading works that have employed the particular nanostructure type. The book examines the advantages of each nanostructure approach and the remaining technical challenges, with an emphasis on possible future areas of research interest. It concludes with a summary of the major processing approaches and challenges of using the various nanostructures to photovoltaics applications, focusing on future scale-up and nanomanufacturing issues. Many books cover photovoltaics and many others nanotechnology ? it is the coverage of both in one resource that sets this book apart.

From reader reviews:

Mary Perez:

Information is provisions for individuals to get better life, information these days can get by anyone in everywhere. The information can be a know-how or any news even a problem. What people must be consider when those information which is inside the former life are hard to be find than now could be taking seriously which one would work to believe or which one the particular resource are convinced. If you obtain the unstable resource then you get it as your main information you will have huge disadvantage for you. All of those possibilities will not happen throughout you if you take Nanotechnology for Photovoltaics as the daily resource information.

Larry Artz:

The publication with title Nanotechnology for Photovoltaics possesses a lot of information that you can learn it. You can get a lot of advantage after read this book. That book exist new information the information that exist in this book represented the condition of the world at this point. That is important to yo7u to understand how the improvement of the world. This particular book will bring you within new era of the syndication. You can read the e-book with your smart phone, so you can read this anywhere you want.

Patsy Phan:

As we know that book is important thing to add our information for everything. By a guide we can know everything we would like. A book is a pair of written, printed, illustrated or blank sheet. Every year seemed to be exactly added. This e-book Nanotechnology for Photovoltaics was filled regarding science. Spend your time to add your knowledge about your research competence. Some people has different feel when they reading a new book. If you know how big benefit from a book, you can feel enjoy to read a e-book. In the modern era like currently, many ways to get book that you just wanted.

Judy Newberry:

As a university student exactly feel bored in order to reading. If their teacher inquired them to go to the library as well as to make summary for some guide, they are complained. Just very little students that has reading's internal or real their passion. They just do what the instructor want, like asked to the library. They go to right now there but nothing reading really. Any students feel that looking at is not important, boring and can't see colorful pics on there. Yeah, it is to get complicated. Book is very important for you. As we know that on this time, many ways to get whatever we would like. Likewise word says, ways to reach Chinese's country. Therefore this Nanotechnology for Photovoltaics can make you feel more interested to read.
